INTRODUCTION FOR NEVIN · NOVEMBER 2026

AUREUM

Capital Allocation Under Immutable Laws

A fair-launch, constitutional capital market on a Balancer V3–derived AMM, with ixEDEL wired in as one of its two routing rails.

THE SHORT VERSION

Aureum in one slide

What it is

A capital market where anyone can create a pool and every pool competes for fixed AuMM emissions under the same on-chain rules.

How capital is allocated

The Continuous Central Bank: a 60-day TVL average times a bounded, anticyclical multiplier. No emission votes, no treasury.

Why it matters for ixEDEL

ixEDEL is one of two routing rails, held in 26 of the 28 founding pools: about 16% of every dollar in them.

Where it stands

A year of research and design, the full spec public at aumm.fi, smart-contract audits in progress now.

WHERE IT CAME FROM

A year of Sagix research, then a fork

MAR 7–10

Druid Deep Dive, Ep. 9

200 years of plumbing failures: the Bank War, the Eurodollar shadow, clearing houses, the Rothschild hub.

MAR 11

The four-layer framework

Liquidity is four layers, not one: pool depth, backstop, pipes, hub. Most of DeFi checks only the first.

MAR 11

Sagix Miliarium Aureum

Dual-anchor pools (svZCHF + ixEDEL) live on Balancer V3. BIP-913 gauges passed with 100%.

MAR 29

The Risk Premium Problem

Emissions are the coupon that pays LPs for risk. Balancer moved to remove them: the catalyst for the fork.

APR → NOV

Aureum

Fork the verified core, replace the economics. Canon at aumm.fi; contracts now in audit.

All essays at sagix.io · mirrored in the aumm.fi canon

THE THESIS

The AMMs worked. The economics failed

GENERATION 1

Bitcoin

Immutable money

- No treasury, no governance, no insiders
- Monetary policy known in advance, applied equally

GENERATION 2

DeFi

Treasury + politics

- Treasuries, emission votes, ve-capture, insider allocations
- The machine ends up producing governance, not capital

GENERATION 3

Aureum

Constitutional capital

- Immutable money and immutable capital allocation
- Autonomous reserve, minimised governance

Bitcoin is to monetary policy what Aureum is to capital allocation.

Balancer V3 is the best AMM in DeFi, and its tokenomics failed anyway: emissions to legacy pools and governance staking, meta-governance capture, a final proposal to end emissions.

WHAT IT IS

Five layers, one closed system

Constitutional governance
Narrow, bounded, on-chain data only. Cannot touch emissions or supply.

der Bodensee
Autonomous reserve: the only destination for protocol revenue.

Continuous Central Bank
Rule-based emission allocation: TVL EMA × bounded multiplier.

Miliarium Aureum + open factory
28 founding pools; anyone can deploy a pool and qualify for emissions under protocol rules.

Aequilibrium
Own Vault, byte-identical to Balancer V3; runs in parallel, not on it.

TWO TOKENS

AuMM

21M cap, Bitcoin-style emission. Earned only by providing liquidity. 100% liquid. Zero governance power.

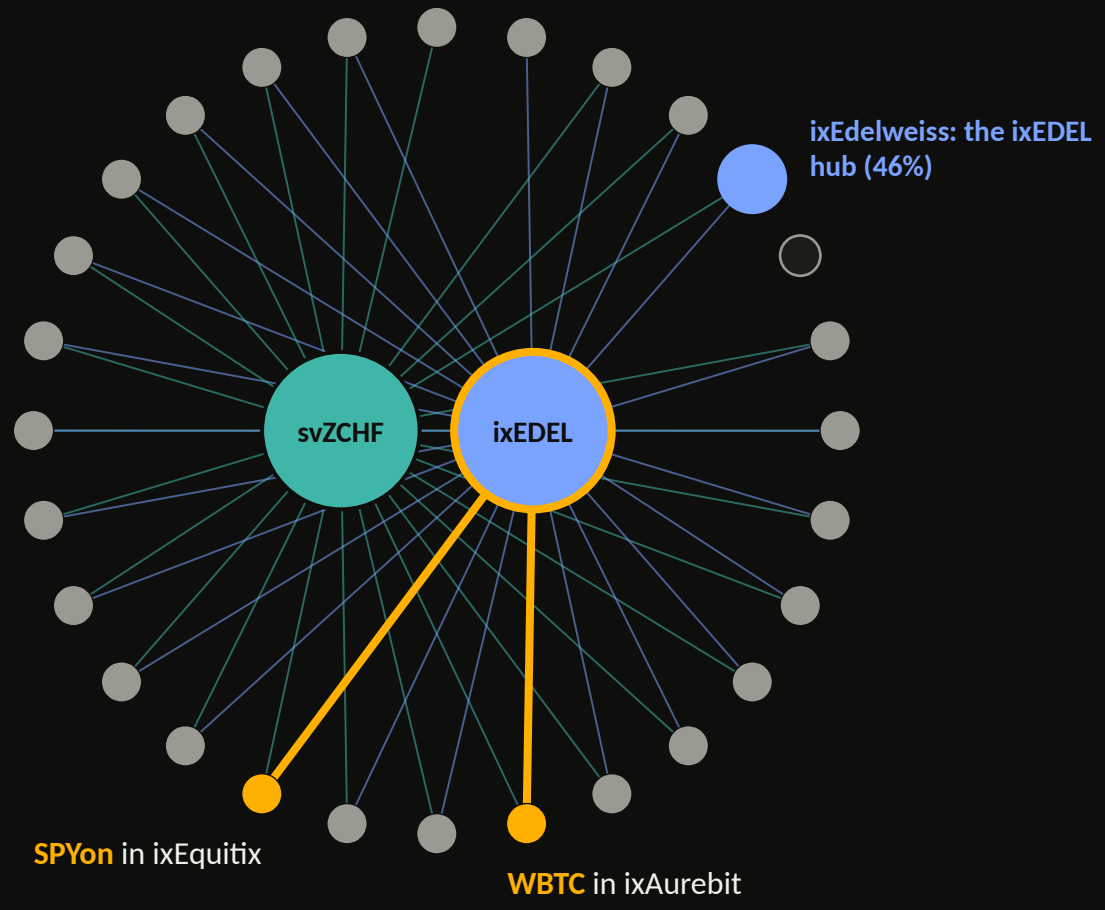

AuMT

Not a new token: each pool's own LP token. Staked, it earns AuMM and carries the vote.

In Rome, a tessera was the token that proved you belonged and carried your rights.

THE SMALL WORLD

Two anchors make 28 pools one market

A Watts–Strogatz small world: tight local clusters plus a few shortcuts give short paths between any two assets.

Local clusters. Each pool: 5 tokens, 10 internal pairs.

Two shortcuts. svZCHF (primary, ~26%, contract-priced, yield-bearing) and ixEDEL (secondary, ~16%, NAV-priced) sit in 26 of 28 pools.

Resilient. Stress in one pool reroutes through the other 25.

Gold path: swap WBTC for SPYon.
WBTC → ixEDEL inside ixAurebit, then ixEDEL → SPYon inside ixEquitix. Two hops, a fee on each, ixEDEL in the middle.

THREE ARBITRAGE LAYERS = STRUCTURAL VOLUME

Yield drift
svZCHF accrues vs pool prices

NAV arbitrage
ixEDEL mint / redeem vs pool

Cross-anchor
the two rails diverge, then reconverge

THE GENESIS MARKET

A miniature economy in 28 pools

Yield
7 pools

01 02 03 04 **05** 06 07

savings · ETH staking · FX · ixEDEL hub · USD hub

Bonds
4 pools

08 09 10 11

Metals
2 pools

27 28

gold · silver + uranium

Blue: 05 ixEdelweiss (46% ixEDEL) and 15 ixRegistrum (ixEDEL, ETH+, OPEN).

Standard pool template

52% Quality Gate. At least 52% of a pool's weight in admitted ERC-4626 vaults, so it earns yield from block 0.

A blueprint, not a closed set. Anyone can create a pool and qualify it for emissions under protocol rules.

WHY THIS MATTERS FOR ixEDEL

Rule-driven, structural demand for ixEDEL

26 of 28

founding pools hold ixEDEL as a routing anchor

~16%

of every dollar in the Miliarium is ixEDEL*

46%

ixEDEL weight in ixEdelweiss, the price-discovery hub

STOCK: ixEDEL HELD AT CONSTANT WEIGHTS

Miliarium TVL	ixEDEL held by the pools*
$10M	~$1.6M
$100M	~$16M
$1B	~$159M

FLOW: VOLUME THAT TOUCHES ixEDEL

Every deposit into an ixEDEL pool needs ixEDEL at its fixed weight.

NAV arbitrage: pool price vs. NAV is closed by minting and redeeming through Reserve.

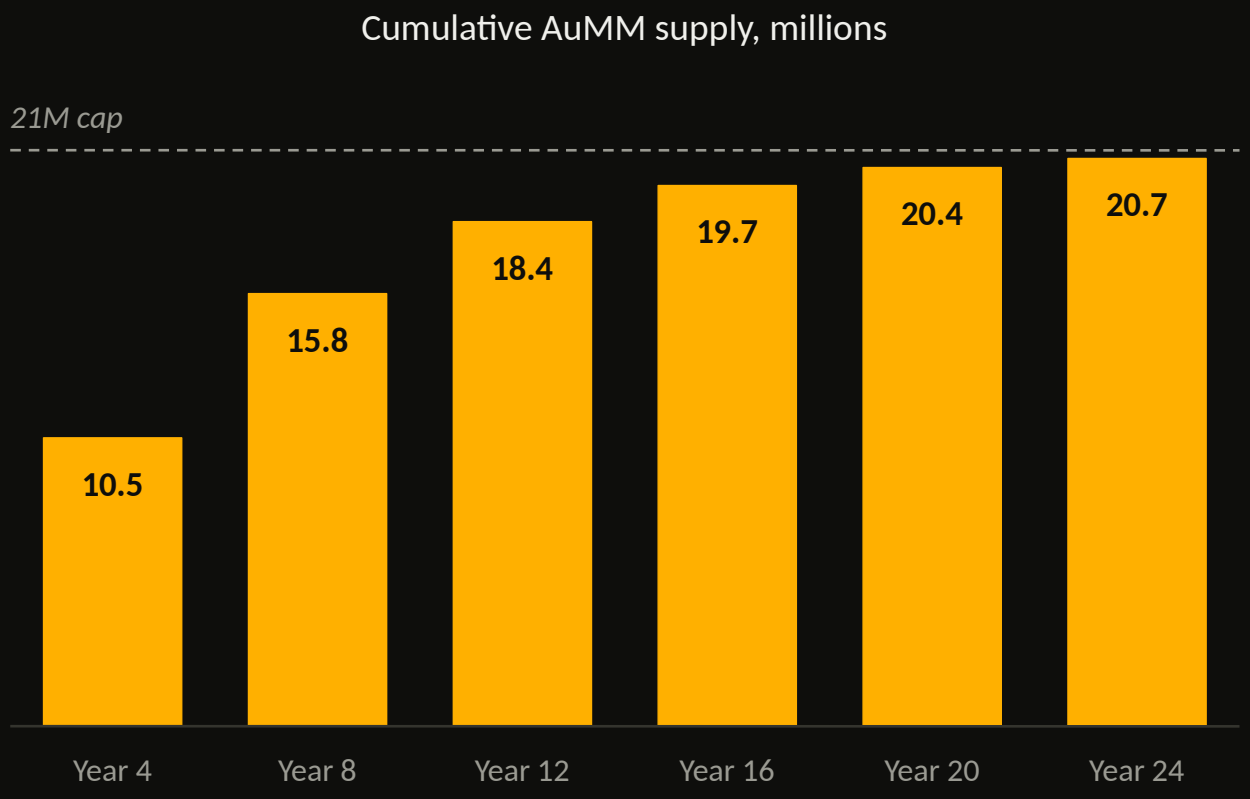

Cross-pool routes and rebalances pass through ixEDEL and ixEdelweiss.

Second order: Index DTF fees scale with ixEDEL supply.

**Illustrative: TVL spread evenly across the 28 pools, at registry weights (445 weight-points of 2,800). Aureum is independent of Reserve; references are factual and imply no affiliation.*

TOKENOMICS

21M AuMM on Bitcoin’s schedule, zero insiders

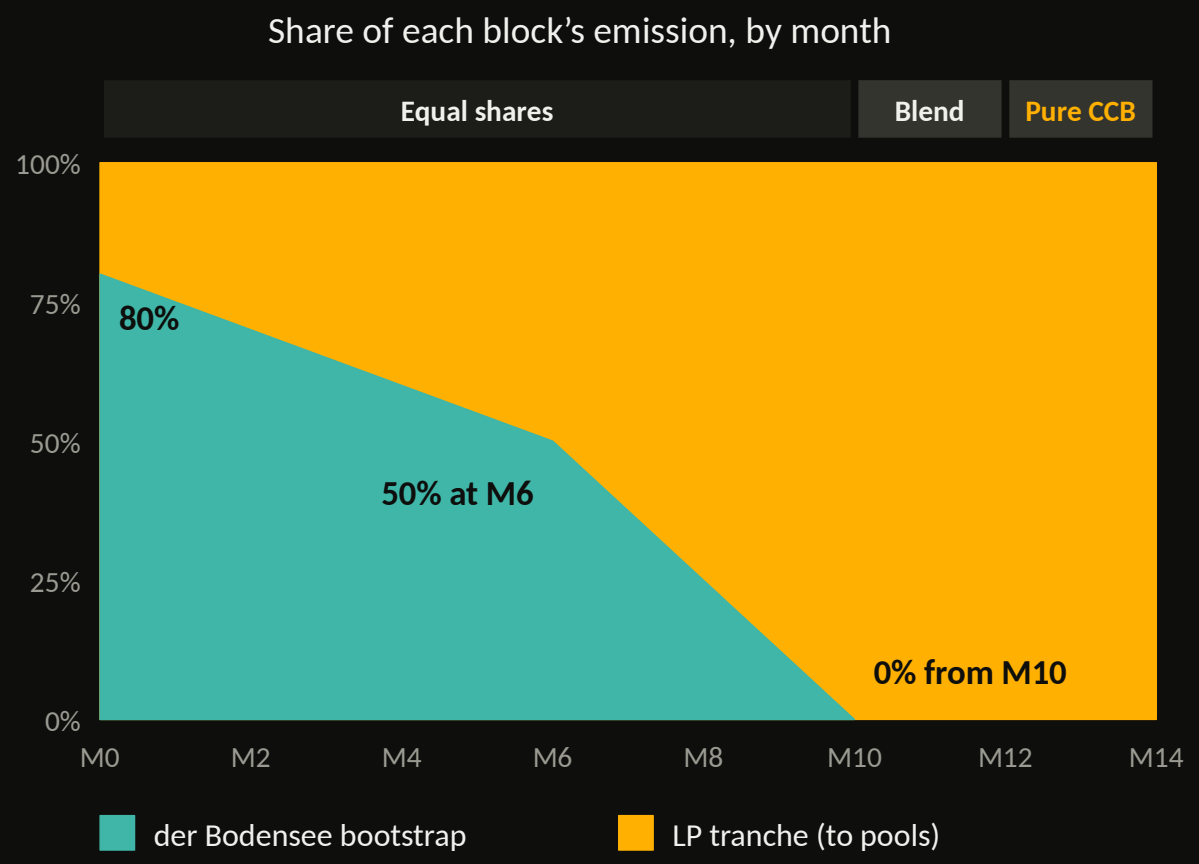

1.00 AuMM per block in Era 0 · halves every 10,512,000 blocks (~4 years) · half of all supply in the first 4 years

0 pre-mine	**0** VC or investor allocation	**0** team allocation
0 treasury	**0** emission votes	**0** lockups or vesting

Mining is LP. The only way to earn AuMM is to stake LP tokens in productive pools. The founding team earns as early LPs, by the same mechanism, with no allocation. What emits is what exists.

LAUNCH SEQUENCE

From equal shares to pure CCB in 12 months

1 **Months 1–10 · Equal**

The LP tranche splits 1/M across the live Miliarium pools. A decaying bootstrap (80% → 50% → 0%) goes to der Bodensee, never to a wallet.

2 **Months 11–12 · Blend**

Equal shares blend linearly into the CCB, half and half at the midpoint. No overnight emission shock.

3 **Year 1 onward · Pure CCB**

Every eligible pool is scored by TVL EMA × multiplier. Incendiary Boost opens: anyone can buy faster emissions for a pool.

THE CONTINUOUS CENTRAL BANK

Emissions follow sustained capital, by rule

TVL EMA (60 days) × **CCB multiplier** = **Score → share = score ÷ Σ scores**

Memory

α = 2/61, sampled daily from a 720-block TWAP. Big moves take weeks to register: sustained capital is rewarded, one-day hype and single whales are filtered out.

A bounded nudge

For the 28 Miliarium pools only. Starts at 1.00, moves ±0.05 per 14-day epoch, clamped to 0.75–1.25, with a 0.1% dead zone.

Anticyclical, two ways

Macro: protocol TVL rising pushes multipliers down; falling pushes them up. Within the 28: pools outgrowing the average are nudged down, laggards up.

No committee, no vote, no oracle: the same rule every block, read from on-chain state.

THE EFFICIENCY TOURNAMENT

Every pool has to earn its emissions

RANKED POOLS, MOST EFFICIENT FIRST

Top 15%
Favored cohort: flagged on-chain, no special allocation

Middle 70%
Full CCB share, no cap

Bottom 15–10%
Capped at 1% of total emissions

Bottom 10–5%
Capped at 0.5% of total emissions

Bottom 5%
Capped at 0.1%: nearly starved

EFFICIENCY RATIO

(swap fees + 4626 yield fees) ÷ AuMM emissions received

Both priced in svZCHF · 6-week moving average · revenue = what the pool sends to der Bodensee

Who is ranked

Gauged pools above the 10,000 svZCHF floor, not Disqualified. Live from month 13 of each pool's life.

Nothing is wasted

Emissions a capped pool can't take go to the uncapped pools, pro-rata by CCB share.

Relative and self-correcting

Pools are ranked against each other, not a fixed bar, so a rising AuMM price can't fail good pools. Capped pools earn fewer emissions, their ratio improves, and they climb out.

WHY DAMPENING MATTERS

Tokenized markets lost their buffers

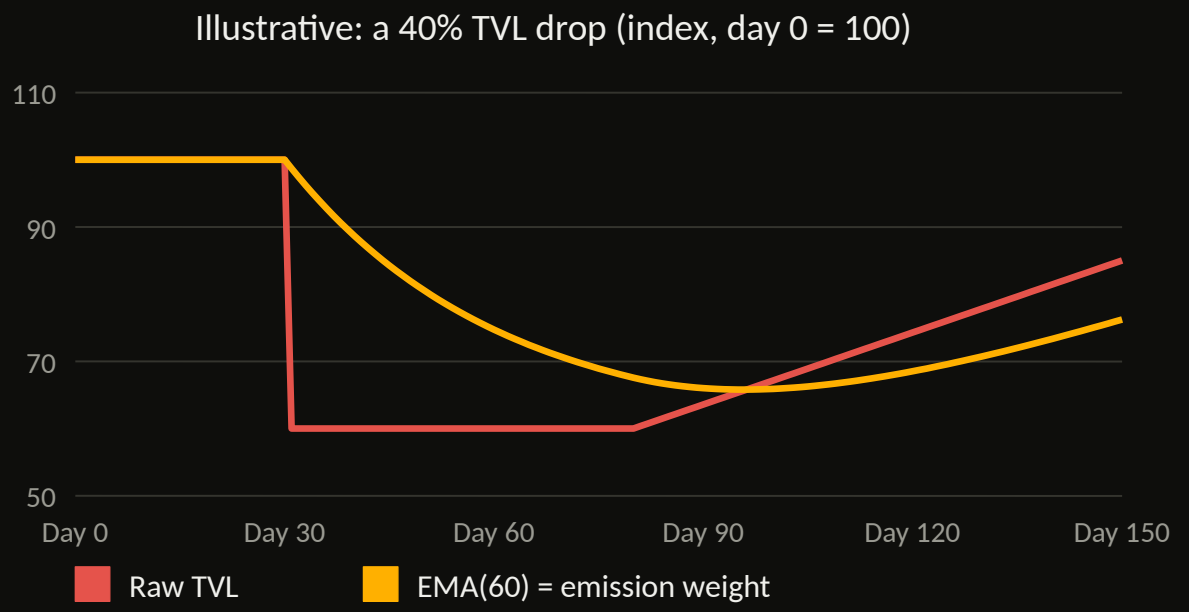

IMF NOTE 26/01 · TOKENIZED FINANCE · APR 2026

Settlement lags used to buy time to net exposures, mobilise liquidity and intervene. Tokenized systems remove those buffers by design, so stress spreads faster, with less room for discretion.

Paraphrased from Tobias Adrian, IMF Notes No. 26/01

BIS (Aramonte et al., 2022): most DeFi is procyclical; it amplifies market moves.

Aureum's answer: if discretion can't arrive in time, the buffer has to be a rule.

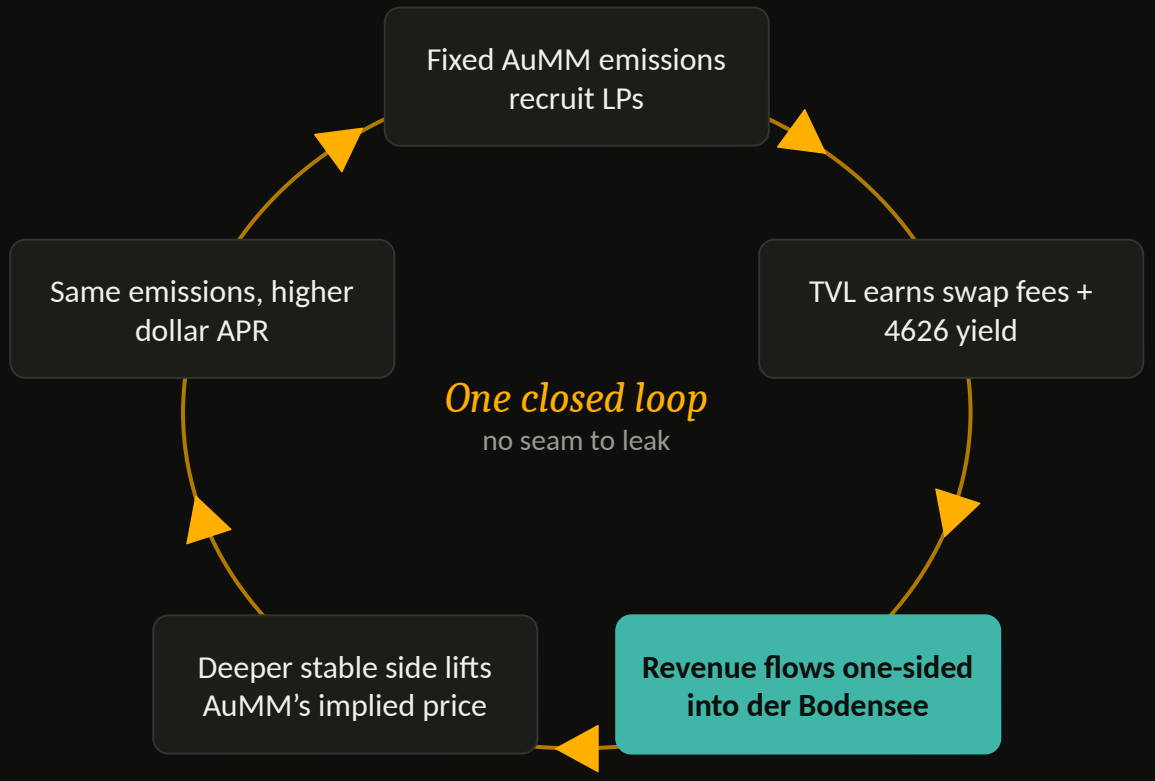

60-day EMA: weight falls slowly, so emissions per remaining dollar rise when capital is scarce.

Anticyclical multiplier: aggregate TVL falling pushes Miliarium multipliers up.

Time locks without locks: 14–28 days to qualify a vote, 6 months to full weight, one fee change per epoch.

VALUE ACCRUAL

A reserve, not a treasury

der Bodensee: fixed 40 / 30 / 30, forever

AuMM 40%	sUSDS 30%	svZCHF 30%

INFLOWS, ALL ONE-SIDED INTO THE STABLE SIDE

99.9999% of swap fees on gauged pools (the protocol share)

10% skim of ERC-4626 yield

Incendiary Boost deposits, governance deposits and vault-class bonds

The 0.75% swap fee inside der Bodensee stays with its LPs. No buyback, no burn, no wallet: pool math sets the price.

A treasury asks who should decide. der Bodensee asks why anyone should.

GOVERNANCE

LP = power, and power is dampened

Only staked LP counts

Votes come from staked AuMT in live gauged pools. AuMM carries none, and no governance token is ever sold.

Dampened

Pool stake to the ¼ power in Era 0, ⅓ after the first halving. Applied per pool, so splitting wallets gains nothing.

Earned over time

Zero weight for 14–28 days, full weight after a 6-month ramp. Any unstake resets to zero.

Hard to capture

20% turnout floor on every vote; 2/3 supermajority for composition and emergency votes.

Era 0 example: a $100M LP against $1M of others holds 99% of votes if linear, ~76% under the fourth root.

Can

- ✓ Swap fees within 0.01–0.30%
- ✓ Challenge non-Miliarium gauges
- ✓ Change a Miliarium pool's composition (2/3)
- ✓ Veto or revoke vault classes
- ✓ Bounded emergency levers

Cannot

- ✗ Emission schedule or supply
- ✗ CCB parameters
- ✗ Fee split to der Bodensee
- ✗ der Bodensee weights or fee
- ✗ Eligibility criteria
- ✗ Dampening exponents

ALLOWED TOKENS

A Frankencoin-style veto decides which vaults count

The protocol's one discretionary surface: which ERC-4626 vault classes count toward the 52% Quality Gate.

1 Propose

Anyone names a vault token and posts a 1,000 svZCHF bond. Non-refundable; it goes to der Bodensee.

2 Veto window

Two epochs (~28 days). Staked-AuMT holders with 10% of qualified voting power can block it.

3 Auto-finalize

No veto, no further vote: the class is admitted in a single transaction.

Why this shape

- A vigilant minority can stop a bad admission.
- Good admissions don't have to win a turnout battle.
- The bond makes spam costly and funds the reserve.

Bounded forever

- Bond ≥ anti-spam fee; veto bar ≤ quorum; window 1–3 epochs.
- Genesis classes hard-coded at deploy.
- Revocation by simple majority; gauged pools keep their gauge.

THE CONSTITUTION

Fixed at block 0, changeable by no one

21,000,000
maximum AuMM supply

~4 years
halving interval (10,512,000 blocks)

α = 2/61
TVL EMA, 60-day horizon

0.75–1.25
CCB multiplier band, ±0.05 per epoch

40 / 30 / 30
der Bodensee: AuMM / sUSDS / svZCHF

99.9999%
protocol share of swap fees → der Bodensee

52%
ERC-4626 Quality Gate

¼ → ⅓
governance root, Era 0 → Era 1

Keys

No admin keys, no upgrades, no multisig. One exception: a 12-month emergency window after the governance handoff, limited to pause and recovery mode. Then it ends for good.

Discipline

Gauged pools must keep earning: volume floors, a 10,000 svZCHF TVL floor, an efficiency tournament that caps the bottom 15%, revocation at the 4th disqualified epoch.

WHERE WE ARE

Designed, specified, now in audit

Research and pilot

Sagix Miliarium live on Balancer V3; ixEDEL/USDC and svZCHF/ZCHF gauges via BIP-913.

Canon published

Constitution, formulas, 28 pool profiles and FAQ at aumm.fi, queryable by AI agents.

Contracts built

Vault byte-identical to Balancer V3, plus Aureum's own tokenomics and governance contracts.

Auditing now

Seam 1 (authority and governance) evaluated; remediation in flight; full external audit next.

Genesis

26 of 28 pools seeded (slots 04 and 07 open); ten-month equal regime begins.

Honest risks

Cold start. TVL is the one input the loop can't engineer.

Routing threshold. Aggregators ignore pools below critical depth.

New code. The tokenomics contracts need independent audit.

Market and regulation. Either can delay adoption.

Every endogenous risk is engineered away: no insider supply, no unlocks, no redirectable emissions. The honest one remains: whether adoption arrives.

SECURITY SO FAR

Our internal audit, before the formal one

- **Verified core, unchanged**
  Vault core byte-identical to Balancer V3, checked against the live deployment.
- **White-hat protocol**
  Internal white-hat pass on the new contracts; F-series ledger, each fixed or accepted.
- **auditician harness: three runs**
  Runs 1–2 done, run 3 running: multi-agent audit plus manual review, frozen snapshots.
- **Corrections carried forward**
  Settled properties and refuted attacks logged, so re-runs only hunt the unknown.
- **Remediation and re-verification**
  Fixes in flight (Stage P-Prime), then the PP6 re-verification suite.
- **Spec-to-code consistency**
  The aumm.fi canon is re-checked against the contracts, rule by rule.
- **Formal external audit (Stage Q)**
  The auditician runs are its baseline; the findings ledger and patch logs then go public.

AUDITICIAN RUNS

Run 1 · done | Run 2 · done | Run 3 · running

RUN 1 RESULTS · SEAM 1 · AUG 2026

82 confirmed findings, found by our own process

Critical 2 | High 17 | Medium 32
Low 14 | Info 17

11 more rejected as invalid; an independent review moved 4 High to Medium.

Rule: every finding needs a named attacker, an ordered call sequence and file:line citations.

LET'S TALK

How do we go forward?

1

Your read on the design

The CCB, LP-weighted governance, the veto model, the ixEDEL rail: what would you change?

2

A closer look at the contracts

Go through the code together: governance, CCB, fee routing to der Bodensee.

3

Formal audit

Scope, auditor and timing for the external audit of Aureum's new contracts.

Also, later: *money and funding. Important, but not the focus of this call.*
